Android Gradle manifestPlaceholders 占位符详解

Android Gradle manifestPlaceholders 占位符详解

在实际项目中, AndroidManifest 里十几个地方的值是需要动态的改变(生成apk文件的时候).如果每次去改也可以,但是累啊,在我之前他们打包是用手动替换,但我觉得这是是在没办法的办法,但是有了 manifestPlaceholders 占位符后就简单的多了,只需要改一个地方就行了.

1. 概括

下面介绍下 manifestPlaceholders 占位符的使用,其实很好理解,你可以认为它可以在build.gradle 文件中定义字符串并将值映射到 AndroidManifest 清单文件的指定位置.

下面说下使用方法:

2. AndroidManifest 文件定义占位符

部分代码如下:

```
<application
2
           android:allowBackup="true"
3
            android:icon="@mipmap/ic launcher"
            android:label="@string/app_name"
            android:supportsRtl="true"
            android:theme="@style/AppTheme">
            <activity android:name=".MainActivity">
                <intent-filter>
 8
9
                    <action android:name="android.intent.action.MAIN"/>
                    <category android:name="android.intent.category.LAUNCHER"/>
10
                </intent-filter>
11
13
                // 这是在Activity 标签下
                <meta-data android:name="nameActivity" android:value="${test_value_activity}"</pre>
14
            </activity>
16
17
             // 这是在Activity 标签下
             <meta-data android:name="nameApplication" android:value="headword${test_value}</pre>
19
        </application>
```

总结如下:

\${你定义名称}

当然 \${} 的前后面直接添加字符串.

例如:

```
1 | android:value="${test_value_activity}"
2 |
3 | android:value="headword${test_value}append_word"
```

3. build.gradle 给占位符赋值

部分代码如下:

```
defaultConfig {
1
            applicationId "com.didikee.wififriend"
2
            minSdkVersion 15
3
            targetSdkVersion 24
4
5
            versionCode 1
6
            versionName "1.0"
7
            testInstrumentationRunner "android.support.test.runner.AndroidJUnitRunner"
8
9
            manifestPlaceholders = [test_value: "这是测试值",test_value_activity:"Activity 耳
10
```

总结如下:

```
manifestPlaceholders = [symbol1: "value1", symbol2:"value2"]
```

多个值时用,分隔开.

3. 在Java代码获取占位符的值

在获取值的时候是区分占位符在 Activity标签,Application标签,service标签,receiver标签下,所以有两种获取方式:

在 Activity标签下:

在 Application标签下:

```
ApplicationInfo applicationInfo = null;
try {
    applicationInfo = getPackageManager().getApplicationInfo(getPackageName())
} catch (PackageManager.NameNotFoundException e) {
    e.printStackTrace();
}
if (applicationInfo == null)return;
String value = applicationInfo.metaData.getString("nameApplication");
```

同理,在 service标签, receiver标签 下分别为:

```
1 | String value= MainActivity.this.getPackageManager().getServiceInfo(ComponentName,Pack
2 |
3 | String value= MainActivity.this.getPackageManager().getReceiverInfo(ComponentName,Pack
2 |
3 | String value= MainActivity.this.getPackageManager().getReceiverInfo(ComponentName,Pack
3 | String value= MainActivity.this.getPackageManager().getReceiverInfo(ComponentName,Pack
3 | String value= MainActivity.this.getPackageManager().getServiceInfo(ComponentName,Pack
3 | String value= MainActivity.this.getPackageManager().getServiceInfo(ComponentName,Pack
3 | String value= MainActivity.this.getPackageManager().getServiceInfo(ComponentName,Pack
3 | String value= MainActivity.this.getPackageManager().getReceiverInfo(ComponentName,Pack
4 | String value= MainActivity.this.getPackageManager().getReceiverInfo(ComponentName,Pack
4 | String value= MainActivity.this.getPackageManager().getReceiverInfo(ComponentName,PackageManager().getReceiverInfo(ComponentName,PackageManager().getReceiverInfo(ComponentName,PackageManager().getReceiverInfo(ComponentName,PackageManager().getReceiverInfo(ComponentName,PackageManager().getReceiverInfo(ComponentName,PackageManager().getReceiverInfo(ComponentName,PackageManager().getReceiverInfo(ComponentName,PackageManager().getReceiverInfo(ComponentName,PackageManager().getReceiverInfo(ComponentName,PackageManager().getReceiverInfo(ComponentName,PackageManager().getReceiverInfo(ComponentName,PackageManager().getReceiverInfo(ComponentName,PackageManager().getReceiverInfo(ComponentName,PackageManager().getReceiverInfo(ComponentName,PackageManager().getReceiverInfo(ComponentName,PackageManager().getReceiverInfo(ComponentName,PackageManager().getReceiverInfo(ComponentName,PackageManager().getReceiverInfo(ComponentName,PackageManager().getReceiverInfo(ComponentName,PackageManager().getReceiverInfo(ComponentName,PackageManager().getReceiverInfo(ComponentName,PackageManager().getReceiverInfo(ComponentName,PackageManager().getReceiverInfo(ComponentName,PackageManager().getReceiverInfo(ComponentName,Pack
```
